

Beamer Skills Library

From research notes to presentation-ready slides

August 14, 2026

Slide production follows a staged workflow

- Draft project progress as editable slides
- Convert structured content into Beamer source
- Apply academic presentation rules before delivery

Three skills cover the authoring workflow

- beamer-presentation: content and layout standards
- beamer-live-draft: interactive HTML drafting and transpilation
- verify-tikz-layout: rendered evidence and visual inspection

Progress drafts stay simple and convertible

- One HTML slide maps to one future Beamer frame
- Title slides and title-plus-bullets slides are supported
- JSON provides a stable handoff between editing and generation

The generator preserves content and flags risks

- Escapes LaTeX special characters automatically
- Warns about empty titles and more than five bullets
- Supports clean, metropolis, and rochester templates

Academic rules keep the deck audience-friendly

- One point per slide with conclusion-driven titles
- Readable fonts, balanced whitespace, and minimal tables
- Main results first; full details move to the appendix

TikZ verification is a separate visual gate

- Compile and render the relevant pages or overlays
- Inspect every required image for overlap and clipping
- Repair layout without changing analytical meaning

Notes become a reproducible PDF workflow

- Edit `progress-draft.html` and export `progress.json`
- Run `generate.py` to produce `slides.tex` and optionally `slides.pdf`
- Review the final deck with the publication and visual checks
